Are folks comfortable with this?

Sampling locations are changing based on wind direction so that we are collecting samples that are most likely to be downwind during the 24-hour sampling period. It's this data that will tell us the most about the chemical make-up of the smoke. We may also make changes in location to collect data from different distances from the fire.

And the wind direction has been shifting so downwind monitors change

I presume the answer is wind direction.

All,

"EPA agreed to collect additional air samples, including particulates, in all locations next week. This data will help scientists and decision-makers better determine if the stump dump contains dangerous chemicals. EPA sampling is scheduled to begin on Monday, December 10 and will include three days of sampling. Quality assured sampling data is expected to be received by EPA on December 21, 2018 and will be shared as soon as possible. "

This is what is on the Bella Vista website. Can someone help me understand why all previous locations we not included in this weeks testing?

Thank you for your time. Look forward to your response.
